

16-string 3 2v lithium battery pack voltage

How do I choose a lithium-ion battery pack?

When selecting a lithium-ion battery pack, understanding its voltage characteristics is crucial for ensuring optimal performance and longevity. Three key voltage terms define a battery's operation: Nominal Voltage, Charged Voltage, and Cut-Off Voltage.

What is the nominal voltage for a 3s Li-ion battery pack?

For a 3S Li-ion battery pack (three cells in series), the nominal voltage would be 10.8V ($3.6V \times 3$).
2. Charged Voltage: The Maximum Voltage When Fully Charged
What Is Charged Voltage? Charged voltage (also called full-charge voltage) is the highest voltage a cell reaches when fully charged.

What is the nominal voltage of a battery pack?

The nominal voltage of the final set of cells is the number of cells in series times the nominal voltage of a single cell. If we look at the battery packs out there we can see that they cover the range of nominal voltages from 3.2V to 820V in the graph (plotted from the Battery Pack Database).

How many volts is a lithium polymer battery?

Single lithium polymer (Li-Po) cells typically have a nominal voltage of 3.7 volts. When the voltage of this type of cell is charged to 4.2 volts, it is considered fully charged. During the battery discharge process, when the voltage drops to 3.27 volts, the battery is considered fully discharged.
