How is solar energy generated?

Solar energy - Electricity Generation: Solar radiation may be converted directly into solar power (electricity) by solar cells, or photovoltaic cells. In such cells, a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different semiconductors.

How do solar panels work?

They are composed of numerous solar cells made of semiconductor materials, typically silicon, which capture solar energy and convert it into usable electricity. When sunlight hits the surface of these panels, it triggers the photovoltaic effect, which is the process that generates electricity.

How does a solar PV system generate electricity?

Solar PV systems generate electricity by absorbing sunlight and using that light energy to create an electrical current. There are many photovoltaic cells within a single solar module, and the current created by all of the cells together adds up to enough electricity to help power your home.

How do solar photovoltaic cells convert sunlight to electricity?

Solar photovoltaic cells are grouped in panels, and panels can be grouped into arrays of different sizes to power water pumps, power individual homes, or provide utility-scale electricity generation. The efficiency that PV cells convert sunlight to electricity varies by the type of semiconductor material and PV cell technology.
