

Does frequency-adaptive dual-mode repetitive control address harmonic compensation degradation in grid-tied inverters?

This paper proposes a frequency-adaptive dual-mode repetitive control (FA-DMRC) strategy for grid-tied inverters to address harmonic compensation degradation in conventional DMRC caused by non-integer delays during grid frequency variations.

Can a grid-connected PWM inverter output high-quality grid current?

This demonstrates that the proposed control strategy enables the grid-connected PWM inverter to output high-quality grid current that complies with the requirements. Figure 13 illustrates the grid current  $i_{g,a}$  can quickly track the reference  $i_{r,a}$  when the setpoint magnitude ( $I_r^*$ ) is switched suddenly between 5A and 10A.

Can grid-connected inverters generate high-quality current?

An FA-DMRC scheme is proposed to enable grid-connected inverters to generate high-quality current even if there are grid frequency variations.

What is the amplitude of grid-tied inverter a?

The test rig of three-phase PWM grid-tied inverter A. Fixed Grid Frequency of 50 Hz Figure. 10 illustrates when solely employing the DB controller, the amplitude of the output grid current  $i_{g,a}$  is around  $\approx$  4.00 A, which is notably less than the target value of 5A.
