

How to stop generating electricity when there is too much wind power

But when extreme weather and very strong winds hit, turbines sometimes need to be shut off. All modern wind turbines are set to stop turning automatically if there's too much energy in ...

But here's the kicker: sometimes we actively prevent turbines from generating electricity even when wind conditions are perfect. Wait, doesn't that defeat the purpose of clean energy? Let's unpack this paradox.

Electricity customers could do a lot to remedy the problem by being flexible in their demand, limiting their electricity use when the grid needs them to. That's not yet widely done in ...

More power is needed in the south of the country, far from where the electricity is being generated. And while the transmission networks can transport electricity great distances, without ...

One solution is to expand energy storage so that generators can save excess power for a few hours instead of sending it straight into the grid. Another option is building more transmission to...

As wind generation capacity has grown in the Midwest of the United States, grid operators have increasingly restricted wind generation because of both oversupply and congestion ...

Each wind farm files daily estimates of the power it plans to generate. When these indicate there will be too much wind power, the network operator intervenes and pays generators in the north ...

Another option is building more transmission to carry power to areas that need it. Both types of investments can reduce the need to curtail generation and forgo making clean, affordable ...

Rather, its main causes include insufficient transmission capacity, the inflexible operation of coal-fired power plants, and a lack of battery storage. As we continue to add more wind resources, ...
