

# Increasing corn yields under photovoltaic panels

A Purdue University research team has demonstrated how to optimize yield in corn fields equipped with solar power arrays that throughout the day cast dynamic shadows across growing crops.

Corn was successfully growing under elevated photovoltaic panels at Purdue University's research farm near West Lafayette, Indiana, in the summer of 2023 as part of a research study.

A research team led by scientists from Purdue University has developed a groundbreaking model designed to optimize corn yield in agrivoltaic systems, which combine ...

Therefore, maintaining crop yield under shading beneath photovoltaic panels is important. Numerous studies have examined the effects of AVSs on yields, predominantly focusing on ...

A new study finds farmers can enjoy increased crop yields under partial shade of solar panels long after they stop working decades from now.

A groundbreaking study conducted by Purdue University has revealed that corn, typically known for its need for full sunlight, can indeed grow effectively under solar panels if they are ...

Researchers have created a novel model that can help developers assess corn growth in agrivoltaic facilities.

Scientists studied the potential of growing corn near solar panels, finding a viable path despite shady conditions. Corn was successfully growing under elevated photovoltaic panels at Purdue University's ...

Solar panels can increase crop yields for certain crops, especially those that benefit from partial shade, though the effect varies by crop type and local climate conditions.

Extensive corn yield data under dynamic shadows from east-west Sun-tracking PV panels has been collected herein. The installation of PV panels and crop growth is done at a scale to ...
