

High-pressure gaseous hydrogen (HPGH 2) storage is a technology with tremendous promise for large-scale application and is presently the mainstream method of storing hydrogen energy.

These Energy Storage Systems are a perfect fit for applications with a high energy demand and variable load profiles, as they successfully cover both low loads and peaks.

High-pressure tanks used in such storage solutions are constructed from materials such as carbon fiber and aluminum. These materials offer a balance of strength, light weight, and ...

In the sub-project Mukran of the BMBF-funded flagship project TransHyDE, spherical and nearly spherical-shaped (isotensoids with short cylindrical spacer) high-pressure tanks are developed...

Tenaris THera™ portfolio covers a wide range of high pressure applications, with hydrogen storage masses ranging between a few kilograms for individual pressure vessels, up to several tonnes for ...

Different commercial types of high-pressure hydrogen storage vessels are compared. The advantages and disadvantages of the manufacturing process for high-pressure hydrogen storage ...

The ZenaLeb project group at Fraunhofer IAP is developing nearly spherical high-pressure tanks that can store hydrogen at 300 bars. This is being done as part of the TransHyDE project "Research into ...

With the COSMOS high-pressure system from heiserTEC, we offer a modular solution that is used worldwide in energy projects, research facilities, and industrial applications.

The development and optimization of high-pressure hydrogen storage tanks, particularly Composite Overwrapped Pressure Vessels (COPVs), represent a crucial advancement in the ...
