

One of the challenges today is to identify the ideal coating and printing techniques for each layer. The ideal process should involve processing the solution of all layers on flexible substrates by combining ...

To fabricate high quality OSC active layers by spin-coating, most of the employed active layer solution is ejected outside of the substrate through centrifugal forces. The wasted active layer ...

Photovoltaic coatings are transforming how solar panels operate and endure in diverse environments. These specialized layers enhance efficiency, durability, and longevity of photovoltaic...

The focus of this paper is to explore and compare several non-vacuum printing and coating processes that have been demonstrated in OPV fabrication, including the materials and ...

In this work, we propose a simple and inexpensive sparking process to produce an AR film. This method uses simple equipment that can be operated in ambient conditions without a high ...

To compare the differences in passivation layers, all perovskite film substrates were prepared using the shear-flow-assisted coating strategy, followed by different methods for ...

PV ribbon tin coating process, including the following steps: (1) substrate selection: selecting an oxygen-free copper strip as the substrate, which is either a bi-plane solder strip or a ...

In this paper, we compare several printing and coating methods that are employed to fabricate OPVs, with the main focus towards the deposition of the active layer.

In this article, we provide a practical, step-by-step guide to making a solar cell using slot-die coating. From preparing the ink and aligning the substrate to coating multiple functional layers ...

This article breaks down the photovoltaic substrate glass production process, explores industry trends, and shares data-driven insights to help manufacturers and renewable energy professionals optimize ...
