

Increase in temperature of PV cells leads to a notable fall in their electrical efficiency, which is known as a major fault of photovoltaic (PV) panels. Among several methods in cooling PV ...

New research from the University of Nottingham has revealed a groundbreaking discovery in the field of solar energy systems. By using wavy pipes instead of traditional straight ...

By relocating and redirecting fluid flow through waves, this design ensures better distribution of heat while preventing hot spots that can lead to efficiency losses in traditional straight ...

A comprehensive simulation model and predictive analysis are employed to investigate the performance of a photovoltaic thermal (PVT) system with a wavy collector tube.

Say goodbye to the straight panel era. Flexible solar films bend to fit curved buildings, opening bold new paths for energy where rigid PVs can't go.

Although the solar tiles they certainly already exist on the market, these are the first with a wavy aesthetic that perfectly manages to camouflage and integrate on roofs like traditional tiles.

The team at Nottingham has used a computer model to study a PVT system with wavy pipes. It was found to work more effectively and also keeps solar panels at an optimum temperature, ...

New research from the University of Nottingham has highlighted how Photovoltaic Thermal (PVT) systems could be made more efficient at converting solar power into usable energy if ...

The present invention relates to the technical field of photovoltaic power generation panels, and disclosed is a solar photovoltaic power generation panel having a wavy surface.

In the push to make renewable energy better, cheaper and easier to set up, a solar panel comprised of lightweight wavy cells is certainly of interest to the scientific community.
