

Understanding UL 1741 is crucial for anyone involved in renewable energy. This standard ensures the safety and efficiency of inverters and other equipment. UL 1741 compliance is essential ...

Inverters used for solar PV and wind plants can provide reactive capability at partial output, but any inverter-based reactive capability at full power implies that the converter need to be sized larger to ...

The North American Electric Reliability Corp. on Jan. 17, 2024, released a three-year plan for developing reliability standards for inverter-based resources, such as wind, solar and battery...

The Essential Grid Operations from Solar project is a national laboratory-led research and industry engagement effort that aims to expedite the development and adoption of reliability standards for ...

UL 1741 is a safety standard for inverter and power converter equipment used in renewable energy systems, including solar, wind, and fuel cell systems.

The standards are the latest in the Commission's series of grid reliability orders pertaining to what are called "inverter-based resources (IBRs)," most commonly wind and solar generators.

Power quality standards exist to guide the interconnection requirements of large wind and solar plants. IEEE guidelines exist for flicker and harmonics, while IEC guidelines exist for the ...

FERC has approved standards requiring solar and wind resources to stay connected during disturbances, boosting grid stability amid increasing inverter-based power sources.

The paper discusses the wind turbine and wind power plant control strategies, and new control approaches, such as grid-forming control, are presented in detail.

Enter: UL1741, a set of the latest grid connection standards that mandate new inverters stay connected and help out. In this article we break down exactly how this strengthens the grid and ...
